

# QuantText Snapshot Programming Integration

Last Modified on 08/17/2021 9:56 pm EDT

## JAVASCRIPT Instructions

- Your Research Manager will supply the lines of JavaScript to be inserted at the point in the survey that the chat is to take place.
- Within the lines of JavaScript is the URL that will launch the QuantText application.
- These JavaScript lines should be on a page devoted to the chat.
- The data collection software must supply a CONTINUE or NEXT button on the bottom of this page.
- Within the link, the value of pre-identified variables from the quantitative survey will need to be added to populate the "User Snapshot". A list of variables to be used in the "User Snapshot" will be supplied by QuantText.
- EACH JAVASCRIPT STRING IS PROJECT SPECIFIC: DO NOT ATTEMPT TO USE THE EXAMPLE HTML BELOW OR OLD JAVASCRIPT FROM A PREVIOUS PROJECT.

## EXAMPLE RAW SCRIPT

The GREEN highlighted text represents the variables to be used in the "User Snapshot".

You will need to pipe the VALUE of each variable---this must be inserted after the equals sign =. Please do not put a space in between.

Respondent # will always be the first variable.

Open Ended Responses will be captured as free text.

Below is an example of what the above script that QuantText would send would look like when completed:

## COMPLETED EXAMPLE
